

beamer named overlay specifications with beanoves

Jérôme Laurens

v1.0 2025/06/03

Abstract

This package allows the management of multiple named overlay specifications in **beamer** documents. Named overlay specifications are very handy both during edition and to manage complex and variable **beamer** overlay specifications. In particular, they allow to replace raw numbers in **beamer** `<...>` overlay specifications by logical identifiers. Demonstration files are [available for download](#) as part of the [development repository](#). As a side effect, this is a solution to this [latex.org forum query](#).

Contents

1 Installation

1.1 Package manager

When not already available, **beanoves** package may be installed using a TEX distribution's package manager, either from the graphical user interface, or with the relevant command (`tlmgr` for **T_EX Live** and `mpm` for **MiK_TE_X**). This should install files **beanoves.sty** and its debug version **beanoves-debug.sty** as well as **beanoves-doc.pdf** documentation.

1.2 Manual installation

The **beanoves** source files are available from the [source repository](#). They can also be fetched from the [CTAN repository](#).

1.3 Usage

The **beanoves** package is imported by putting `\RequirePackage{beanoves}` in the preamble of a **L^AT_EX** document that uses the **beamer** class. Should the package cause problems, its features can be temporarily deactivated with simple commands `\BeanovesOff` and `\BeanovesOn`.

2 Minimal example

The L^AT_EX document below is a contrived example to show how the **beamer** overlay specifications have been extended. More demonstration files are available from the [beanoves source repository](#).

```
1 \documentclass{beamer}
2 \RequirePackage{beanoves}
3 \begin{document}
4 \Beanoves {
5   A = 1:4,
6   B = A.last::3,
7   C = B.next,
8 }
9 \begin{frame}
10  {\Large Frame \insertframenum}
11  {\Large Slide \insertslidenum}
12 -- \visible<?(A.1)> {Only on slide 1}\\
13 -- \visible<?(B.range)> {Only on slides 4 to 6}\\
14 -- \visible<?(C.1)> {Only on slide 7}\\
15 -- \visible<?(A.2)> {Only on slide 2}\\
16 -- \visible<?(B.2:B.last)> {Only on slides 5 to 6}\\
17 -- \visible<?(C.2)> {Only on slide 8}\\
18 -- \visible<?(A.next)-> {From slide 5}\\
19 -- \visible<?(B.3:B.last)> {Only on slide 6}\\
20 -- \visible<?(C.3)> {Only on slide 9}\\
21 \end{frame}
22 \end{document}
```

On line 4, we use the `\Beanoves` command to declare *named overlay sets*. On line 5, we declare an overlay set named ‘A’, which is a range starting at slide 1 and ending at slide 4. On line 12, the extended *named overlay specification* `?(A.1)` stands for 1 because 1 is the first index of the overlay set named A. On line 15, `?(A.2)` stands for 2 whereas on line 18, `?(A.next)` stands for 5. On line 6, we declare a second overlay set named ‘B’, starting after the 3 slides of ‘A’ namely 4. Its length is 3 meaning that its last slide number is 6, thus each `?(B.last)` is replaced by 6. The next slide number after slide range ‘B’ is 7 which is also the start of the third slide range due to line 7.

3 Named overlay sets

3.1 Presentation

Within a **beamer** frame, there are different slides that appear in turn according to overlay specifications. The main overlay set is a range of integers covering all the slide numbers, from one to the total amount of slides. In general, an overlay set is a range of positive integers identified by a unique name. The main practical interest is that such sets may be defined relative to one another, we can even have lists of overlay sets. Finally, we can use these lists to build and organize **beamer** overlay specifications logically.

3.2 Named overlay reference

A.1, C.2 are *named overlay references*, as well as A and X!A.B.C.2. More precisely, they are string identifiers, each one referencing a well defined static integer or list of ranges to be used in beamer overlay specifications. They have 2 components:

1. the *frame identifier* $\langle id \rangle$ before the exclamation mark !, like X, in X!A.B.C.2, optional
2. the *path* $\langle c_1 \rangle \dots \langle c_j \rangle$ like A.B.C, required ($j > 0$).

The *full path* is $\langle id \rangle! \langle c_1 \rangle \dots \langle c_j \rangle$. The *frame ids* and path components $\langle c \rangle$'s are alphanumeric case sensitive identifiers, with possible underscores but with no space. Unicode symbols above U+00A0 are allowed if the underlying T_EX engine supports it. Only the *frame id* is allowed to be empty, in which case it may apply to any common frame. The *path components* must not consist of only lowercase letters¹.

The mapping from *named overlay references* to sets of integers is defined at the global T_EX level to allow its use in `\begin{frame}<...>` and to share the same overlay sets between different frames. Hence the *frame id* due to the need to possibly target a particular frame.

3.3 Defining named overlay sets

In order to define *named overlay sets*, we can either execute the next `\Beanoves` command before a beamer frame environment, or use the custom `beanoves` option of this environment.

`\Beanoves` `\Beanoves{\langle ref_1 \rangle=\langle spec_1 \rangle, \dots, \langle ref_j \rangle=\langle spec_j \rangle}`

`\Beanoves*` Each $\langle ref \rangle$ key is a *named overlay reference* whereas each $\langle spec \rangle$ is an *overlay set specifier*. When the same $\langle ref \rangle$ key is used multiple times, only the last one is taken into account.

When performed at the document level, the `\Beanoves` command starts by cleaning what was set by previous calls. When performed inside L^AT_EX environments, each new call cumulates with the previous one. Notice that the argument of this function can contain macros: they will be exhaustively expanded at resolution time².

`beanoves` `beanoves = {\langle ref_1 \rangle=\langle spec_1 \rangle, \dots, \langle ref_j \rangle=\langle spec_j \rangle}`

The `\Beanoves` arguments take precedence over both the `\Beanoves*` arguments and the `beanoves` options. This allows to provide an overlay name only when not already defined, which is helpfull when the very same frame source is included multiple times in different contexts. Notice that $\langle ref \rangle=1$ can be shortened to $\langle ref \rangle$.

3.3.1 Value specifiers

Hereafter $\langle value \rangle$ denotes a numerical expression.

¹This will avoid collisions with the `fp` module of `expl3`.

²Precision is needed about the exact time when the expansion occurs.

Standalone

$\langle \text{ref} \rangle = \langle \text{value} \rangle$, a *value specifier* for a single number. When $= \langle \text{value} \rangle$ is omitted it defaults to $=1$.

The numerical expressions are evaluated and then rounded using `\fp_eval:n`. They can contain mathematical functions and *named overlay references* defined above. If this reference concerns a set of values, only the first one is considered.

The corresponding overlay set can be seen as a *value counter*.

3.3.2 Colon delimited range specifiers

In beamer, integer ranges are denoted by $\langle \text{first} \rangle - \langle \text{last} \rangle$. In order to authorize algebraic expressions for $\langle \text{first} \rangle$ and $\langle \text{last} \rangle$, the dash character $-$ is replaced by a colon $:$ in beanoes. Hereafter $\langle \text{first} \rangle$, $\langle \text{last} \rangle$ and $\langle \text{length} \rangle$ are placeholders for *value specifiers*.

Standalone

$\langle \text{ref} \rangle = \langle \text{first} \rangle :$,
 $\langle \text{ref} \rangle = \langle \text{first} \rangle ::$, for the infinite range of signed integers starting at and including $\langle \text{first} \rangle$.

$\langle \text{ref} \rangle = \langle \text{first} \rangle : \langle \text{last} \rangle$,
 $\langle \text{ref} \rangle = \langle \text{first} \rangle :: \langle \text{length} \rangle$,
 $\langle \text{ref} \rangle = : \langle \text{last} \rangle :: \langle \text{length} \rangle$,
 $\langle \text{ref} \rangle = :: \langle \text{length} \rangle : \langle \text{last} \rangle$, are variants for the same finite range of signed integers starting at and including $\langle \text{first} \rangle$, ending at and including $\langle \text{last} \rangle$, provided $\langle \text{first} \rangle + \langle \text{length} \rangle = \langle \text{last} \rangle + 1$. $\langle \text{first} \rangle$ can be omitted, in which case it defaults to 1. Additionally $: \langle \text{last} \rangle$ and $:: \langle \text{length} \rangle$ are then equivalent.

$\langle \text{ref} \rangle = : \langle \text{last} \rangle$,
 $\langle \text{ref} \rangle = :: \langle \text{length} \rangle$, are syntactic sugar when $\langle \text{first} \rangle$ is 1.

3.3.3 List specifiers

$\langle \text{ref} \rangle = [\langle \text{def}_1 \rangle, \dots, \langle \text{def}_j \rangle]$, where $\langle \text{def}_k \rangle$, $1 \leq k \leq j$, is one of

- $\langle \text{index} \rangle = \langle \text{value} \rangle$,
- $\langle \text{value} \rangle$, a shortcut for $\langle i \rangle = \langle \text{value} \rangle$, $\langle i \rangle$ being the smallest positive integer such that $\langle \text{ref} \rangle . \langle i \rangle$ is not already defined.

The first step is to remove previous $\langle \text{ref} \rangle$ related definitions, then execute the various $\langle \text{ref} \rangle . \langle i \rangle = \langle \text{value} \rangle$ definitions in the order given. Here is the **implementation**.

$\langle \text{ref} \rangle = \{ \langle \text{def}_1 \rangle, \dots, \langle \text{def}_j \rangle \}$, where $\langle \text{def}_k \rangle$, $1 \leq k \leq j$, is one of

- $\langle \text{name} \rangle = \langle \text{spec} \rangle$,
- $\langle \text{name} \rangle$ for $\langle \text{name} \rangle = 1$,

The first step is to remove previous $\langle \text{ref} \rangle$ related definitions, then execute the various $\langle \text{ref} \rangle . \langle \text{name} \rangle = \langle \text{spec} \rangle$ definitions in the order given. In a final step, the $\langle \text{name} \rangle$'s are collected in a comma separated list to initialize $\langle \text{ref} \rangle$ with. $\langle \text{spec} \rangle$ is any specifier. Here is the **implementation**.

4 Resolution of $\langle \dots \rangle$ query expressions

This is the key feature of the `beanoves` package, extending `beamer overlay specifications` normally included between pointed brackets. Before the *overlay specifications* are processed by the `beamer` class, the `beanoves` package scans them for any occurrence of $\langle \langle \text{queries} \rangle \rangle$. Each one is then evaluated and replaced by its resolved static counterpart. The overall result is finally forwarded to the `beamer` class.

The $\langle \text{queries} \rangle$ argument is a comma separated list of individual $\langle \text{query} \rangle$'s processed from left to right as explained below. Notice that nesting a $\langle \dots \rangle$ query expression inside another query expression is supported, embedded expressions being resolved first.

The named overlay sets defined above are queried for integer numerical values that will be passed to `beamer`. Turning an *overlay query* into the static expression it represents, as when above $\langle A.1 \rangle$ was replaced by 1, is denoted by *overlay query resolution* or simply *resolution*. The process starts by replacing any *query reference* by its value as explained below until obtaining numerical expressions that are evaluated and finally rounded to the nearest integer to feed `beamer` with either ranges or numbers. When the *query reference* is a previously declared $\langle \text{ref} \rangle$, like **A** after **A=1**, it is simply replaced by the corresponding declared $\langle \text{value} \rangle$, here 1. Otherwise, we use *implicit overlay queries* and their *resolution rules* depending on the definition of the named overlay set. Hereafter $\langle i \rangle$ denotes a signed integer whereas $\langle \text{value} \rangle$, $\langle \text{first} \rangle$, $\langle \text{last} \rangle$, $\langle \text{length} \rangle$ and $\langle i \text{ expr} \rangle$ stand for raw integers or more general numerical expressions that are evaluated beforehand.

Resolution occurs only when requested and the result is cached for performance reason.

4.1 Range overlay queries

We give the resolution of queries after named overlay sets are defined.

$\langle \text{ref} \rangle = \langle \text{first} \rangle$: as well as $\langle \text{first} \rangle ::$ define a range limited from below:

overlay query	resolution
$\langle \text{ref} \rangle$	$\langle \text{first} \rangle -$
$\langle \text{ref} \rangle.1$	$\langle \text{first} \rangle$
$\langle \text{ref} \rangle.2$	$\langle \text{first} \rangle + 1$
$\langle \text{ref} \rangle.\langle i \rangle$	$\langle \text{first} \rangle + \langle i \rangle - 1$
$\langle \text{ref} \rangle[\langle i \text{ expr} \rangle]$	$\langle \text{first} \rangle + \langle i \text{ expr} \rangle - 1$
$\langle \text{ref} \rangle.\text{previous}$	$\langle \text{first} \rangle - 1$
$\langle \text{ref} \rangle.\text{first}$	$\langle \text{first} \rangle$

Notice that $\langle \text{ref} \rangle.\text{previous}$ and $\langle \text{ref} \rangle.0$ are most of the time synonyms.

$\langle \text{ref} \rangle = \langle \text{first} \rangle : \langle \text{last} \rangle$ as well as variants $\langle \text{first} \rangle :: \langle \text{length} \rangle$, $:: \langle \text{length} \rangle : \langle \text{last} \rangle$ or $: \langle \text{last} \rangle :: \langle \text{length} \rangle$, which are equivalent provided $\langle \text{first} \rangle + \langle \text{length} \rangle = \langle \text{last} \rangle + 1$.

Define a range limited from both above and below:

overlay query	resolution
$\langle \text{ref} \rangle$	$\langle \text{first} \rangle - \langle \text{last} \rangle$
$\langle \text{ref} \rangle.1$	$\langle \text{first} \rangle$
$\langle \text{ref} \rangle.2$	$\langle \text{first} \rangle + 1$
$\langle \text{ref} \rangle.\langle i \rangle$	$\langle \text{first} \rangle + \langle i \rangle - 1$
$\langle \text{ref} \rangle[\langle i \text{ expr} \rangle]$	$\langle \text{first} \rangle + \langle i \text{ expr} \rangle - 1$
$\langle \text{ref} \rangle.\text{previous}$	$\langle \text{first} \rangle - 1$
$\langle \text{ref} \rangle.\text{first}$	$\langle \text{first} \rangle$
$\langle \text{ref} \rangle.\text{last}$	$\langle \text{last} \rangle$
$\langle \text{ref} \rangle.\text{next}$	$\langle \text{last} \rangle + 1$
$\langle \text{ref} \rangle.\text{length}$	$\langle \text{length} \rangle$

Notice that the resolution of the $\langle \text{ref} \rangle$ overlay query is a beamer range and not an algebraic difference, negative integers do not make sense there while in `beamer` context.

In the frame example below, we use the `\BeanovesResolve` command for the demonstration. It is mainly used for debugging and testing purposes.

```

1 \Beanoves {
2   A = 3:8, % or similarly A = 3::6, A = ::6:8 and A = :8::6
3 }
4 \begin{frame} {Frame \insertframenum} {Slide \insertslidenumber}
5 \ttfamily
6 \BeanovesResolve[show] (A)          == 3-8,
7 \BeanovesResolve[show] (A.1)       == 3,
8 \BeanovesResolve[show] (A.-1)      == 1,
9 \BeanovesResolve[show] (A.previous) == 2,
10 \BeanovesResolve[show] (A.first)   == 3,
11 \BeanovesResolve[show] (A.last)    == 8,
12 \BeanovesResolve[show] (A.next)    == 9,
13 \BeanovesResolve[show] (A.length)  == 6,
14 \end{frame}

```

$\langle \text{ref} \rangle = [\dots]$

$\langle \text{ref} \rangle = \{\dots\}$ See the list range specifiers in section 3.3.3.

4.2 Value counter queries

$\langle \text{ref} \rangle = \langle \text{value} \rangle$ defines a counter value.

overlay query	resolution
$\langle \text{ref} \rangle$	$\langle \text{value} \rangle$
$\langle \text{ref} \rangle.1$	$\langle \text{value} \rangle$
$\langle \text{ref} \rangle.2$	$\langle \text{value} \rangle + 1$
$\langle \text{ref} \rangle.\langle i \rangle$	$\langle \text{value} \rangle + \langle i \rangle - 1$
$\langle \text{ref} \rangle[\langle i \text{ expr} \rangle]$	$\langle \text{value} \rangle + \langle i \text{ expr} \rangle - 1$
$\langle \text{ref} \rangle.\text{previous}$	$\langle \text{value} \rangle - 1$
$\langle \text{ref} \rangle.\text{first}$	$\langle \text{value} \rangle$
$\langle \text{ref} \rangle.\text{last}$	$\langle \text{value} \rangle$
$\langle \text{ref} \rangle.\text{next}$	$\langle \text{value} \rangle + 1$

Additionally, resolution rules are provided for dedicated *overlay queries*. Here, $\langle ref \rangle$ is considered a standard programming variable:

$\langle ref \rangle = \langle set\ expression \rangle$, resolve $\langle set\ expression \rangle$, assign the result to the $\langle ref \rangle$ and use it. It defines $\langle ref \rangle$ globally if not already done. Here $\langle set\ expression \rangle$ is the longest character sequence with no space³. To remove this limitation, use an embedded query expression or enclose the `clist` item within a pair of braces.

$\langle ref \rangle += \langle integer\ expression \rangle$, resolve $\langle integer\ expression \rangle$ into $\langle integer \rangle$, advance $\langle ref \rangle$ by $\langle integer \rangle$ and use the result.

$++\langle ref \rangle$, increment $\langle ref \rangle$ by 1 and use it.

$\langle ref \rangle ++$, use $\langle ref \rangle$ and then increment it by 1.

This can be used for an indirection.

IN PROGRESS

```

1 \Beanoves {
2   A = 1,
3   B = [ 10 = 100 ],
4   C = 10,
5 }
6 \begin{frame} {Frame \insertframenum} {Slide \insertslidenumber}
7 \ttfamily
8 \BeanovesResolve[show] (A.C)      == \BeanovesResolve[show] (A.10) == 10,
9 \BeanovesResolve[show] (B.C)      == \BeanovesResolve[show] (B.10) == 100,
10 \BeanovesResolve[show] (A.C+=10) == \BeanovesResolve[show] (A.20) == 20,
11 \BeanovesResolve[show] (A.C)      == \BeanovesResolve[show] (A.20) == 20,
12 \BeanovesResolve[show] (A.C+=10) == \BeanovesResolve[show] (A.20) == 20+10,
13 \BeanovesResolve[show] (A.C)      == \BeanovesResolve[show] (A.20) == 30,
14 \BeanovesResolve[show] (B.C)      == \BeanovesResolve[show] (B.20) == 20,
15 \end{frame}

```

In order to decrement a counter, one can increment with a negative value, no dedicated syntax is provided yet.

For each new frame, these counters are reset to the value they were initialized with. Sometimes, resetting the counter manually is necessary, for example when managing `tikz` overlay material.

`\BeanovesReset` `\BeanovesReset` [*options*] [$\langle ref_1 \rangle [= \langle spec_1 \rangle]$, ..., $\langle ref_j \rangle [= \langle spec_j \rangle]$]

This command is very similar to `\Beanoves`, except that a standalone $\langle ref_i \rangle$ resets the counter to the last value it was initialized with, and that it is meant to be used inside a `frame` environment. Each $= \langle spec_j \rangle$ is optional and defaults to `=1`. When the `all` option is provided, some internals that were cached for performance reasons are cleared as well.

4.3 The beamer counters

While inside a `frame` environment, it is possible to save the current value of the `beamerpauses` counter that controls whether elements should appear on the current slide. For that, we can execute one of `\Beanoves{\langle ref \rangle=pauses}` or in a query

³The parser for algebraic expression is very rudimentary.

?(...($\langle\text{ref}\rangle$ =pauses)...). Then later on, we can use ?(...($\langle\text{ref}\rangle$)...) to refer to this saved value in the same frame⁴. Next frame source is an example of usage.

```

1 \begin{frame}
2 \visible<+>{A}\\
3 \visible<+>{B\Beanoves{afterB=pauses}}\\
4 \visible<+>{C}\\
5 \visible<?(afterB)>{other C}\\
6 \visible<?(afterB.previous)>{other B}\\
7 \end{frame}

```

“A” first appears on slide 1, “B” on slide 2 and “C” on slide 3. On line 2, `afterB` takes the value of the `beamerpauses` counter once updated, *id est* 3. “B” and “other B” as well as “C” and “other C” appear at the same time. If the `beamerpauses` counter is not suitable, we can execute instead one of `\Beanoves{ $\langle\text{ref}\rangle$ =slideinframe}` or inside a query ?(...)($\langle\text{ref}\rangle$ =slideinframe)(...). It uses the numerical value of `\insertslideinframe`.

4.4 Multiple queries

It is possible to replace the comma separated list of queries ?($\langle\text{query}_1\rangle$),...,?($\langle\text{query}_j\rangle$) with the shorter single query ?($\langle\text{query}_1\rangle$,..., $\langle\text{query}_j\rangle$).

4.5 Overriding the default resolution

After `\Beanoves{A = 3:8}`, `A.first` is resolved into 3. With a supplemental instruction `\Beanoves{A.first = 10}`, `A.first` is then resolved into 10 whereas `A.1` is still resolved into 3.

4.6 Frame id

Except for very special situations, the *frame ids* can be left unspecified. When no *frame id* was explicitly provided, `beanoves` uses the *last frame id* and, if the resolution fails, an empty *frame id*. At the beginning of each frame, the *last frame id* is set to the *frame id* of the current frame, which is denoted *current frame id* and is empty by default. Then it gets updated after each named reference resolution where a *frame id* is explicitly given. For example, the first time `A.1` reference is resolved within a given frame, it is first translated to $\langle\text{last frame id}\rangle!$ A.1, but when used just after `Y!C.2`, for example, it becomes a shortcut to `Y!A.1` because the *last frame id* is then `Y`.

In order to set the *frame id* of the current frame to frame $\langle id\rangle$, use the new `beanoves` id option of the `beamer` frame environment.

`beanoves id` `beanoves id= $\langle\text{frame id}\rangle$ ,`

We can use the same $\langle\text{frame id}\rangle$ for different frames to share named overlay sets. Another possibility offered by the `beanoves` package to share named overlay sets is a fall back mechanism, for example when `X!A` cannot be resolved, `!A` is resolved instead.

⁴See [stackexchange](#) for an alternative that needs at least two passes.

4.7 Resolution command

`\BeanovesResolve` `\BeanovesResolve` [`\setup`] {`\queries`}

This function resolves the `\queries`, which are like the argument of `?(...)` instructions: a comma separated list of single `\query`'s. It is mainly used for debugging purposes. The optional `\setup` is a key-value list:

`show` the result is left into the input stream

`in:N=<command>` the result is stored into `<command>`.

5 Support

See the [source repository](#). One can report issues there.

6 Implementation

Identify the internal prefix (L^AT_EX3 DocStrip convention).

1 `\@@=bnvs`

6.1 Package declarations

```

2 \NeedsTeXFormat{LaTeX2e}[2025/01/01]
3 \ProvidesExplPackage
4   {beanoves}
5   {2025/06/03}
6   {1.0}
7   {Named overlay specifications for beamer}
```

6.2 Overview

Reserved namespace: identifiers containing the case insensitive string `beanoves` or containing the case insensitive string `bnvs` delimited by two non characters.

There are mainly two steps: parsing and resolution. Parsing occurs while executing the `\Beanoves` command to build a data model whereas the resolution translates queries into `beamer` specifications based on this data model.

The development is made easier due to a facility layer over `expl`.

6.3 Facility layer: definitions and naming

In order to make the code shorter and easier to read during development, we add a layer over L^AT_EX3. The `c` and `v` argument specifiers take a slightly different meaning when used in a function which name contains `bnvs` or `BNVS`. Where L^AT_EX3 would transform `l__bnvs_ref_tl` into `\l__bnvs_ref_tl`, `bnvs` will directly transform `ref` into `\l__bnvs_ref_tl`. The type of the local variable used depends on the context and may be `seq` or `int` for example. There are however a pair of exceptions mentioned below. For a better reading experience, “`ref`” will generally stand for `\l__bnvs_ref_tl`, whereas

“path sequence” will generally stand for `\l__bnvs_path_seq`. Other similar shortcuts are used as well.

Functions with BNVS in their names are management functions. They belong to a deeper layer and do not really contain any logic specific to the `beanoves` package.

```
\BNVS:c    \BNVS:c {<cs core name>}
\BNVS_l:cn \BNVS_l:cn {<local variable core name>} {<type>}
\BNVS_g:cn \BNVS_g:cn {<global variable core name>} {<type>}
```

These are naming functions internally used to focus on the discriminating part of variable or function names.

```
8 \cs_new:Npn \BNVS:c    #1    { __bnvs_#1    }
9 \cs_new:Npn \BNVS_l:cn #1 #2 { l__bnvs_#1_#2 }
10 \cs_new:Npn \BNVS_g:cn #1 #2 { g__bnvs_#1_#2 }
```

```
\BNVS_use_raw:N \BNVS_use_raw:N <cs>
\BNVS_use_raw:c \BNVS_use_raw:c {<cs name>}
\BNVS_use_raw:Nc \BNVS_use_raw:Nc <function> {<cs name>}
\BNVS_use_raw:nc \BNVS_use_raw:nc {<tokens>} {<cs name>}
\BNVS_use:c      \BNVS_use:c {<cs core>}
\BNVS_use:Nc     \BNVS_use:Nc <function> {<cs core>}
\BNVS_use:nc     \BNVS_use:nc {<tokens>} {<cs core>}
```

`\BNVS_use_raw:c` is a convenient wrapper over `\use:c`. possibly prepended with some code, for debugging and testing. It needs 3 expansion steps just like `\BNVS_use:c`. The other are used to expand `\use:c` enough before usage by `<function>` or `<tokens>`. The first argument of `<function>` has type N. The next token after `<tokens>` will have type N too. `<cs name>` is a full cs name whereas `<cs core>` will be prepended with the appropriate prefix specific to the `beanoves` package.

```
11 \cs_new:Npn \BNVS_use_raw:N #1 { #1 }
12 \cs_new:Npn \BNVS_use_raw:c #1 {
13   \exp_last_unbraced:No
14   \BNVS_use_raw:N { \cs:w #1 \cs_end: }
15 }

16 \cs_new:Npn \BNVS_use:c #1 {
17   \BNVS_use_raw:c { \BNVS:c { #1 } }
18 }

19 \cs_new:Npn \BNVS_use_raw:NN #1 #2 {
20   #1 #2

6.3.1 Debug

<code>\BNVS_DEBUG_ON:</code>	<code>\BNVS_DEBUG_ON:</code>
<code>\BNVS_DEBUG_OFF:</code>	<code>\BNVS_DEBUG_OFF:</code>
<code>\BNVS_DEBUG_push:nn</code>	<code>\BNVS_DEBUG_push:nn {⟨types on⟩} {⟨types off⟩}</code>
<code>\BNVS_DEBUG_pop:</code>	<code>\BNVS_DEBUG_pop:</code>

These functions activate or deactivate the debug mode. They are only active in the `beanoves-debug` package. Manage debug messaging for one given *⟨type⟩* or *⟨types⟩*. The implementation is not publicly exposed. The *⟨type⟩* is a single letter or `**`.

6.3.2 Facility layer: Functions

<code>\BNVS_new:cpn</code>	<code>\BNVS_new:cpn</code> is like <code>\cs_new:cpn</code> except that the name argument is tagged for <code>beanoves</code>
<code>\BNVS_set:cpn</code>	package. Similarly for <code>\BNVS_set:cpn</code> .

```

51 \cs_new:Npn \BNVS_new:cpn #1 {
52   \cs_new:cpn { \BNVS:c { #1 } }
53 }

54 \cs_new:Npn \BNVS_set:cpn #1 {
55   \cs_set:cpn { \BNVS:c { #1 } }
56 }

```

```

57 \cs_generate_variant:Nn \cs_generate_variant:Nn { c }
58 \cs_new:Npn \BNVS_generate_variant:cn #1 {
59   \cs_generate_variant:cn { \BNVS:c { #1 } }
60 }

```

6.3.3 logging

\BNVS_warning:n	\BNVS_warning:n {<message>}
\BNVS_warning:x	\BNVS_error:n {<message>}
\BNVS_error:n	\BNVS_fatal:n {<message>}
\BNVS_error:x	Very rudimentary. No long message available for error recovery.
\BNVS_fatal:n	
\BNVS_fatal:x	

```

61 \msg_new:nnn { beanoves } { :n } { #1 }
62 \msg_new:nnn { beanoves } { :nn } { #1~(#2) }

63 \cs_new:Npn \BNVS_warning:n {

```

6.4 Debug facilities

Typesetting file `beanoves.dtx` creates both `beanoves` and `beanoves-debug` style files. The former is intended for everyday use whereas the latter contains supplemental debugging and testing facilities which are intentionally left undocumented. For example, we have aliases for `\group_begin:` and `\group_end:` to allow the display of supplemental informations while debugging. We also have some techniques for coverage as well as inline testing.

6.5 Local variables

We make heavy use of local variables and function scopes. Many functions are executed within a `TEX` group, which ensures no name collision with the caller stack. The number of variables used has not been optimized, nor the `TEX` groups used. Optimization often goes against readability. Next local variables are used by different functions. These are one word letter variables.

`\l__bnvs_I_tl`: A frame identifier

`\l__bnvs_J_tl`: The last frame identifier

`\l__bnvs_K_tl`: ! as regex caught group, if non empty.

`\l__bnvs_S_tl`: A short name, a regex caught group.

`\l__bnvs_P_tl`: A path, a regex caught group.

`\l__bnvs_N_tl`: The representation of an unsigned decimal integer.

649   \__bnvs_tl_put_right:cn { ans } 0
650   \BNVS_error:x
651 }

```

In order to implement the provide feature, we add getters and setters

```

652 \BNVS_new:cpn { set_true:c } #1 {
653   \exp_args:Nc \bool_set_true:N { \BNVS_1:cn { #1 } { bool } }
654 }

655 \BNVS_new:cpn { set_false:c } #1 {
656   \exp_args:Nc \bool_set_false:N { \BNVS_1:cn { #1 } { bool } }
657 }

```

6.6 Infinite loop management

Unending recursivity is managed here.

`\g__bnvs_call_int` Some functions calls, as well as some loop bodies, decrement this counter. When this counter reaches 0, an error is raised or a computation is aborted.

(End of definition for `\g__bnvs_call_int`.)

```

658 \int_const:Nn \c__bnvs_max_call_int { 8192 }

```

`\__bnvs_greset_call:` `\__bnvs_greset_call:`

Reset globally the call stack counter to its maximum value.

```

659 \BNVS_new:cpn { greset_call: } {
660   \int_gset:Nn \g__bnvs_call_int { \c__bnvs_max_call_int }
661 }

```

`\__bnvs_if_call:TF` `\__bnvs_call_do:TF` `{⟨yes:⟩} {⟨no:⟩}`

Decrement the `\g__bnvs_call_int` counter globally and execute `⟨yes:⟩` if we have not reached 0, `⟨no:⟩` otherwise.

```

662 \BNVS_new_conditional:cpnn { if_call: } { T, F, TF } {
663   \int_gdecr:N \g__bnvs_call_int
664   \int_compare:nNnTF \g__bnvs_call_int > 0 {
665     \prg_return_true:
666   } {
667     \prg_return_false:
668   }
669 }

```

6.7 Overlay specification

6.7.1 Registration

We keep track of the $\langle id \rangle! \langle path \rangle$ combinations and provide looping mechanisms. Hereafter, $\langle id \rangle$, $\langle path \rangle$ and $\langle key \rangle$ allways represent pure strings.

```

__bnvs_g_IPK:w  __bnvs_g_IPK:w {<id>} {<path>} {<key>}
__bnvs_g_IP:w   __bnvs_g_IP:w  {<id>} {<path>}
__bnvs_g_I:w    __bnvs_g_I:w   {<id>}

```

Create a unique global name from the arguments.

```

670 \BNVS_new:cpn { g_IPK:w } #1 #2 #3 { g__bnvs@#1!#2/#3_tl }
671 \BNVS_new:cpn { g_IP:w } #1 #2 { g__bnvs@#1!#2_keys_seq }
672 \BNVS_new:cpn { g_I:w } #1 { g__bnvs@#1_paths_seq }

```

$\backslash g_bnvs_I_seq$ Global list of globally registered identifiers.

(End of definition for $\backslash g_bnvs_I_seq$.)

```

673 \seq_new:N \g__bnvs_I_seq

```

6.7.2 Data model

The whole data model is somehow similar to a hierarchical file system: the $\langle id \rangle$ corresponds to the drive, the $\langle path \rangle$ points to a directory, each directory may contain individual files. File named “=” contains initial data whereas file named “@” contains the static resolved data. The latter is initially undefined and becomes empty as soon as the initial data is defined or set. In order to allow index override, files respectively named “ $\langle N \rangle$ ” and “ $@ \langle N \rangle$ ” are used similarly, $\langle N \rangle$ denoting a normalized integer (no leading 0, no leading + sign). The dot (.) is used to separate components of $\langle path \rangle$.

6.7.3 Low level IPK model functions

These are **gset** and **gunset** functions. Each **gset** function must be balanced by a **gunset** function to prevent “memory leaks”.

```

__bnvs_gset:nnnn  __bnvs_gset:nnnn {<id>} {<path>} {<key>} {<def>}
__bnvs_gset:(nnnv|nnne|vnvn|nvnn|nvvn|vvnn|vvnv)

```

Manage the storage. Keep track of all the $\langle path \rangle$ ’s for a given $\langle id \rangle$ and all the $\langle key \rangle$ ’s for a given $\langle id \rangle! \langle path \rangle$ combination.

Implementation details, next macros are defined lazily at the global level:

- $\backslash_bnvs_gset@ \langle id \rangle! \langle path \rangle:nn \{ \langle key \rangle \} \{ \langle def \rangle \}$,
- $\backslash_bnvs_gset@ \langle id \rangle:nnn \{ \langle path \rangle \} \{ \langle key \rangle \} \{ \langle def \rangle \}$,
- $\backslash g_bnvs@ \langle id \rangle!_paths_tl$, records all $\langle path \rangle$ for $\langle id \rangle$,
- $\backslash g_bnvs@ \langle id \rangle! \langle path \rangle_keys_tl$, records all $\langle key \rangle$ for $\langle id \rangle! \langle path \rangle$,
- $\backslash g_bnvs@ \langle id \rangle! \langle path \rangle_keys_tl$,

- `\g__bnvs@<id>!<path>/<key>_tl`, record the `<def>` for the `<id>!<path>/<key>` combination.

799 }

```

6.7.4 Loops

```

\__bnvs_foreach_I:N \__bnvs_foreach_I:N {function:n}
\__bnvs_foreach_I:n \__bnvs_foreach_I:n {<n code>}
\__bnvs_foreach_I_break: \__bnvs_foreach_I_break:
\__bnvs_foreach_I_break:n \__bnvs_foreach_I_break:n {<code>}

```

Execute the $\langle function:n \rangle$ or the $\langle n code \rangle$ for each declared identifier. The break commands work like `\seq_map_break:` and

```

800 \BNVS_new:cpn { foreach_I:N } {
801 \seq_map_function:NN \g__bnvs_I_seq
802 }
803 \BNVS_new:cpn { foreach_I:n } {
804 \seq_map_inline:Nn \g__bnvs_I_seq
805 }

```

```

806 \cs_set_eq:NN \__bnvs_foreach_I_break: \seq_map_break:
807 \cs_set_eq:NN \__bnvs_foreach_I_break:n \seq_map_break:n

```

```

\__bnvs_foreach_P:nNTF \__bnvs_foreach_P:nNTF {<id>} <function:nn> {<yes:>} {<no:>}
\__bnvs_foreach_P:nnTF \__bnvs_foreach_P:nnTF {<id>} {<:nn code>} {<yes:>} {<no:>}

```

If $\langle id \rangle$ is a declared identifier, execute $\langle function:nn \rangle$ or $\langle code \rangle$ for each combination of $\langle id \rangle$ and its associate $\langle path \rangle$ s. Both are the arguments passed to $\langle function:nn \rangle$ or $\langle :nn code \rangle$ (through ##1 and ##2).

```

808 \BNVS_new_conditional:cpnn { foreach_P:nN } #1 #2 { T, F, TF } {
809   \seq_if_exist:cTF { \__bnvs_g_I:w { #1 } } {
810     \seq_map_inline:cn {
811       \__bnvs_g_I:w { #1 }
812     } {
813       #2 { #1 } { ##1 }
814     }
815     \prg_return_true:
816   } {
817     \prg_return_false:
818   }
819 }
820 \BNVS_new_conditional:cpnn { foreach_P:nn } #1 #2 { T, F, TF } {
821   \seq_if_exist:cTF { \__bnvs_g_I:w { #1 } } {
822     \cs_set:Npn \BNVS_foreach_P_nn:nn ##1 ##2 { #2 }
823     \seq_map_inline:cn { \__bnvs_g_I:w { #1 } } {
824       \BNVS_foreach_P_nn:nn { #1 } { ##1 }
825     }
826     \prg_return_true:
827   } {
828     \prg_return_false:
829   }
830 }

```

```

\__bnvs_foreach_K:nnN \__bnvs_foreach_K:nnN {<id>} {<path>} <function:nnn>
\__bnvs_foreach_K:nnn \__bnvs_foreach_K:nnn {<id>} {<path>} {<:nnn code>}

```

Execute the $\langle function:nnn \rangle$ or the $\langle :nnn code \rangle$ for each of $\langle id \rangle!$ $\langle path \rangle$ / $\langle key \rangle$ combination. These are the arguments to the function or code argument.

```

831 \BNVS_new:cpn { foreach_K:NnnN } #1 #2 #3 #4 {
832   \seq_if_exist:NT #1 {
833     \seq_map_inline:Nn #1 {
834       #4 { #2 } { #3 } { ##1 }
835     }
836   }
837 }
838 \BNVS_new:cpn { foreach_K:nnN } #1 #2 #3 {
839   \exp_args:Nc \__bnvs_foreach_K:NnnN
840   { \__bnvs_g_IP:w { #1 } { #2 } }
841   { #1 } { #2 } #3
842 }
843 \BNVS_new:cpn { foreach_K:nnn } #1 #2 #3 {
844   \cs_set:Npn \BNVS_foreach_K_nnn:w ##1 ##2 ##3 { #3 }
845   \__bnvs_foreach_K:nnN { #1 } { #2 } \BNVS_foreach_K_nnn:w
846 }

```

```

__bnvs_foreach_IP:N  __bnvs_foreach_IP:N <function:nn>
__bnvs_foreach_IP:n  __bnvs_foreach_IP:n {<:nn code>}

```

Execute the $\langle function:nn \rangle$ or the $\langle :nn \text{ code} \rangle$ for each $\langle id \rangle! \langle path \rangle$ combination.

```

847 \BNVS_new:cpn { foreach_IP:N } #1 {
848   __bnvs_foreach_I:n {
849     __bnvs_foreach_P:nNT { ##1 } #1 { }
850   }
851 }

852 \BNVS_new:cpn { foreach_IP:NT } #1 #2 {
853   __bnvs_foreach_I:n {
854     __bnvs_foreach_P:nNT { ##1 } #1 { #2 }
855   }
856 }

857 \BNVS_new:cpn { foreach_IP:n } #1 {
858   \cs_set:Npn \BNVS_foreach_IP_n:nn ##1 ##2 { #1 }
859   __bnvs_foreach_I:n {
860     __bnvs_foreach_P:nNT { ##1 } \BNVS_foreach_IP_n:nn { }
861   }
862 }

```

6.7.5 Low level IP model functions

6.7.6 Low level I model functions

6.7.7 Getting

```

__bnvs_if_get:nnnTF  __bnvs_if_get:nnnTF {<id> } {<path>} {<key>} {<yes:n>} {<no:>}
__bnvs_if_spec:nnnTF  __bnvs_if_spec:nnnTF {<id> } {<path>} {<key>} {<yes:n>} {<no:>}

```

The `__bnvs_if_get:nnnTF` variant calls $\langle yes:n \rangle$ with what was stored for $\langle id \rangle! \langle path \rangle / \langle key \rangle$. Otherwise executes $\langle no:>$ without changing the contents of the $\langle ans \rangle$ t1 variable.

The `_spec:` variant is similar except that it uses $\langle id \rangle! \langle path \rangle / \langle key \rangle$ combinations when available or $! \langle path \rangle / \langle key \rangle$ otherwise.

```

863 \BNVS_new:cpn { if_get:nnnTF } #1 #2 #3 #4 #5 {
864   __bnvs_is_gset:nnnTF { #1 } { #2 } { #3 } {
865     \cs_set:Npn \BNVS:n ##1 { #4 }
866     \exp_args:Nv \BNVS:n { __bnvs_g_IPK:w { #1 } { #2 } { #3 } }
867   } {
868     #5
869   }
870 }

871 \BNVS_new:cpn { if_spec:nnnTF } #1 #2 #3 #4 #5 {
872   __bnvs_is_gset:nnnTF { #1 } { #2 } { #3 } {
873     \cs_set:Npn \BNVS:n ##1 { #4 }
874     \exp_args:Nv \BNVS:n { __bnvs_g_IPK:w { #1 } { #2 } { #3 } }
875   } {
876     \tl_if_empty:nTF { #1 } {

```

```

877     #5
878   } {
879     \__bnvs_is_gset:nnnTF {} { #2 } { #3 } {
880       \cs_set:Npn \BNVS:n ##1 { #4 }
881       \exp_args:Nv \BNVS:n { \__bnvs_g_IPK:w {} { #2 } { #3 } }
882     } {
883       #5
884     }
885   }
886 }
887 }

```

<code>__bnvs_if_get:nnncTF</code> <code>__bnvs_if_spec:nnncTF</code> <code>__bnvs_if_get:nnncTF</code> <code>__bnvs_if_get:vvncTF</code>	<code>__bnvs_if_get:nnncTF {<id>}{<path>}{<key>}{<ans>}{<yes:>}{<no:>}</code> <code>__bnvs_if_spec:nnncTF {<id>}{<path>}{<key>}{<ans>}{<yes:>}{<no:>}</code> <code>__bnvs_if_get:nnncTF {<id>}{<path>}{<ans>}{<yes:>}{<no:>}</code>
---	--

The `\__bnvs_if_get:nnnc...` variant puts what was stored for `<id>!``<path>/<key>` into the `<ans>` variable, if any, then executes `<yes:>`. Otherwise executes `<no:>` without changing the contents of the `<ans>` `tl` variable.

`\__bnvs_if_get:nnncTF` is a convenient shortcut for `\__bnvs_if_get:nnncTF` when `<key>` and `<ans>` happen to be the same.

The `_spec:` variant is similar except that it uses `<id>!``<path>/<key>` combinations when available or `!``<path>/<key>` otherwise.

```

888 \BNVS_new_conditional:cpnn { if_get:nnnc } #1 #2 #3 #4 { T, F, TF } {

904   } {
905     \tl_if_empty:nTF { #1 } {
906       \prg_return_false:
907     } {
908       \__bnvs_if_spec:nnncTF {} { #2 } { #3 } { #4 }
909       \prg_return_true: \prg_return_false:
910     }
911   }
912 }
913 \BNVS_undefine:c { if_spec:nnnc }

```

```

914 \BNVS_new_conditional:cpnn { if_get:nnc } #1 #2 #3 { T, F, TF } {
915   \__bnvs_if_get:nnncTF { #1 } { #2 } { #3 } { #3 }
916   \prg_return_true: \prg_return_false:
917 }

918 \BNVS_new_conditional:cpnn { if_get:vvc } #1 #2 #3 { T, F, TF } {
919   \BNVS_tl_use:Nvv \__bnvs_if_get:nncTF { #1 } { #2 } { #3 }
920   \prg_return_true: \prg_return_false:
921 }

```

__bnvs_if_resolved:nnncTF __bnvs_if_resolved:nnncTF {<id>} {<path>} {<key>} {<ans>} {<yes:>} {<no:>}

Execute <yes:> if resolution succeeded for either <id>!<<path>/<key> or the fallback <path>/<key>, otherwise execute <no:>.

```

922 \BNVS_new_conditional:cpnn { if_resolved:nnnc } #1 #2 #3 #4 { T, F, TF } {
923   \__bnvs_if_get:nnncTF { #1 } { #2 } { #3 } { #4 } {
924     \__bnvs_is_will_gset:cTF { #3 }
925     \prg_return_true: \prg_return_false:
926   } {
927     \tl_if_empty:nTF { #1 } {
928       \prg_return_false:
929     } {

1017 }

```

6.7.8 Circular dependencies

```

\__bnvs_will_gset:nnn \__bnvs_will_gset:nnn {<id>} {<path>} {<key>}

```

To manage circular dependencies. After this command, `\__bnvs_is_will_gset:nnnTF` is true for the same arguments.

```

1018 \BNVS_new:cpn { will_gset:nnn } #1 #2 #3 {
1019   \__bnvs_gset:nnnn { #1 } { #2 } { #3 } { \q_no_value }
1020 }

```

```

__bnvs_is_will_gset:cTF __bnvs_is_will_gset:cTF {<id>} {<yes:>} {<no:>}

```

To manage circular dependencies. See `__bnvs_will_gset:nnn` above.

```

1  __bnvs_will_gset:nnn {<id>} {<path>} {<key>}
2  ...
3  __bnvs_if_get:nnncT {<id>} {<path>} {<key>} {<in>} {
4    ...
5    __bnvs_is_will_gset:cTF
6      {<in>}
7      {<yes:>}
8      {<no:>}
9    ...
10 }

```

```

1021 \BNVS_new_conditional:cpnn { is_will_gset:c } #1 { T, F, TF } {
1022   \BNVS_tl_use:Nv \quark_if_no_value:nTF { #1 } {
1023     \prg_return_true:
1024   } {
1025     \prg_return_false:
1026   }
1027 }

```

6.7.9 Spring cleaning

```

__bnvs_gclear:nn  __bnvs_gclear:nn {<id>} {<path>}
__bnvs_gclear:nv  __bnvs_gclear:n  {<id>}
__bnvs_gclear:    __bnvs_gclear:
__bnvs_greset:nn  __bnvs_greset:nn {<id>} {<path>}
__bnvs_greset:nv  __bnvs_greset:n  {<id>}
__bnvs_greset:    __bnvs_greset:

```

The first ones clear out every data stored for `<id>!``<path>`, including deeper and registration data. When `<path>` is omitted, any known path is considered. When `<id>` is omitted, any known id is considered. The second one only clears out the data created on the fly after the initialization step. The initial data (for key =) is left untouched.

```

1028 \BNVS_new:cpn { greset:nn } #1 #2 {
1029   __bnvs_foreach_P:nnT { #1 } {
1030     \tl_if_in:nnT { \q_bnvs ##2 . } { \q_bnvs #2 . } {
1031       __bnvs_foreach_K:nnn { #1 } { ##2 } {
1032         \tl_if_in:nnF { \q_bnvs ####3 } { \q_bnvs = } {
1033           __bnvs_gunset:nnn { #1 } { ##2 } { ####3 }
1034         }
1035       }
1036     }
1037   } { }
1038 }

```

Clears out every data associated to `<id>!``<path>`, and any `<id>!``<path>.``<subpath>`.

```

1039 \BNVS_new:cpn { gclear:nn } #1 #2 {

```

```

1040 \__bnvs_foreach_P:nnT { #1 } {
1041   \tl_if_in:nnT { \q_bnvs ##2 . } { \q_bnvs #2 . } {
1042     \__bnvs_foreach_K:nnn { #1 } { ##2 } {
1043       \tl_if_in:nnTF { \q_bnvs ####3 } { \q_bnvs = } {

1060 }
1061 \BNVS_new:cpn { greset: } {
1062   \__bnvs_foreach_IP:N \__bnvs_greset:nn
1063 }

```

```

\__bnvs_gclear_resolved:nn \__bnvs_gclear_resolved:nn {<id>} {<path>}
\__bnvs_gclear_resolved:nv

```

Clear the resolved data, aka any key that does not start with “=”.

```

1064 \BNVS_new:cpn { gclear_resolved:nn } #1 #2 {
1065   \__bnvs_foreach_IP:nnn { #1 } { #2 } {
1066     \tl_if_in:nnF { @ ##1 } { @ = } {
1067       \__bnvs_gunset:nnn { #1 } { #2 } { ##1 }
1068     }
1069   }
1070 }
1071 \BNVS_new:cpn { gclear_resolved:nv } #1 {
1072   \BNVS_tl_use:nv {
1073     \__bnvs_gclear_resolved:nn { #1 }
1074   }
1075 }

```

6.7.10 The provide mode

`\l__bnvs_provide_bool` Manage the provide mode.

```

1076 \bool_new:N \l__bnvs_provide_bool
      (End of definition for \l__bnvs_provide_bool.)

1077 \BNVS_new:cpn { provide_ON: } {
1078   \__bnvs_set_true:c { provide }
1079 }
1080 \BNVS_new:cpn { provide_OFF: } {
1081   \__bnvs_set_false:c { provide }
1082 }
1083 \__bnvs_provide_OFF:

```

```

__bnvs_if_should_provide:nnnTF __bnvs_if_should_provide:nnnTF {<id>} {<path>} {<key>} {<yes:>} {<no:>}}
__bnvs_if_should_provide:nnTF __bnvs_if_should_provide:nnTF {<id>} {<path>} {<yes:>} {<no:>}}

```

Execute <yes:> when in provide mode and <id>!
<path>/<key> is known, <no:> otherwise.
When not specified, <key> is “=”.

```

1084 \BNVS_new_conditional:cpnn { if_should_provide:nnn } #1 #2 #3 { T, F, TF } {
1085   __bnvs_if:cTF { provide } {
1086     __bnvs_is_gset:nnnTF { #1 } { #2 } { #3 } {

```

6.7.11 Initialize

Here, <simple definition> contains no <key>-<value> material, even implicit.

<code>_bnvs_ginit:nnn</code> <code>_bnvs_ginit:(nnv vvn)</code>	<code>_bnvs_ginit:nnn {<id>} {<path>} {<simple definition>}</code> This function supports provide mode by calling <code>_bnvs_is_gset_and_provide:nnnTF</code> . Somehow a shortcut to <code>_bnvs_gset:nnnn</code> with key “=”. If <path> has more than one component, each intermediate path is modified or defined appropriately.
--	--

```

1137 \BNVS_new:cpn { ginit:nnn } #1 #2 #3 {
1138   \\_bnvs_is_gset_and_provide:nnnF { #1 } { #2 } = {
1139     \\_bnvs_greset:nn { #1 } { #2 }
1140     \\_bnvs_gset:nnnn { #1 } { #2 } = { #3 }
1141   }
1142 }
1143 \BNVS_new:cpn { ginit:nnv } #1 #2 {
1144   \BNVS_tl_use:nv { \\_bnvs_ginit:nnn { #1 } { #2 } }
1145 }
1146 \BNVS_new:cpn { ginit:vvv } {
1147   \BNVS_tl_use:Nvv \\_bnvs_ginit:nnn
1148 }

```

<code>_bnvs_ginit_ITPD:w</code>	<code>_bnvs_ginit_ITPD:w {<id>} {<path>} {<index>} {<simple definition>}</code> This functions supports provide mode by calling <code>_bnvs_is_gset_and_provide:nnnTF</code> . Somehow a shortcut to <code>_bnvs_gset:nnnn</code> with key <index>. When <index> is provided, it is already normalized. If <id>!<path>/= is not set, it is initialized from <definition> shifted appropriately relative to <index>.
-----------------------------------	--

```

1149 \BNVS_new:cpn { ginit_ITPD:w } #1 #2 #3 #4 {
1150   \\_bnvs_is_gset_and_provide:nnnF { #1 } { #2 } { #3 } {
1151     \\_bnvs_gunset:nnn { #1 } { #2 } { #3 }
1152     \\_bnvs_gset:nnnn { #1 } { #2 } { =#3 } { #4 }

```

```

1153 }
1154 \__bnvs_is_gset:nnnF { #1 } { #2 } = {
1155   \__bnvs_gset:nnne { #1 } { #2 } = {
1156     \exp_not:n { #4 } - \int_eval:n { #3 - 1 }
1157   }
1158 }
1159 }

```

6.7.12 Provide mode

__bnvs_is_provided:nnnTF __bnvs_is_provided:nnnTF {<id>} {<path>} {<key>} {<yes:>} {<no:>}

If $\langle id \rangle! \langle path \rangle / \langle key \rangle$ has been successfully resolved and not unset since then, execute $\langle yes: \rangle$. Otherwise execute $\langle no: \rangle$.

```

1160 \tl_new:N \l__bnvs_is_provided_tl
1161 \BNVS_new_conditional:cpnn { is_provided:nnn } #1 #2 #3 { T, F, TF } {
1162   \__bnvs_if_get:nnncTF { #1 } { #2 } { #3 } { is_provided } {
1163     \__bnvs_is_will_gset:cTF { is_provided } {
1164       \prg_return_false:
1165     } {
1166       \prg_return_true:
1167     }
1168   } {
1169     \prg_return_false:
1170   }
1171 }

```

6.8 Regular expressions

$\backslash c_bnvs_S_regex$ This regular expression is used for both short names and dot path components. The short name of an overlay set consists of a non void list of alphanumerical characters and underscore, but with no leading digit. It must contain one uppercase letter.

```

1172 \regex_const:Nn \c__bnvs_S_regex {
1173   (? : [a-z_] [a-z0-9_]* )? [A-Z] [[:alnum:]]*
1174 }

```

(End of definition for \c__bnvs_S_regex.)

$\backslash c_bnvs_R_regex$ A possibly empty list of $\langle short\ name \rangle$ items representing a path.

```

1175 \regex_const:Nn \c__bnvs_R_regex {
1176   (? : \. \ur{c__bnvs_S_regex} )*

1398      #3
1399    }
1400    \BNVS:n { #1 }
1401  }
1402 }

```

__bnvs_normalize:nTF **__bnvs_normalize:nTF** {<var>} {<yes:n>} {<no:n>}

If <var> contains a decimal integer annotation, as detected by **__bnvs_if_N:nTF**, normalize it (for example remove leading zeros) and call <yes:n> with it.

```

1403 \BNVS_new:cpn { normalize:nTF } #1 #2 #3 {
1404   \__bnvs_if_N:nTF { #1 } {
1405     \cs_set:Npn \BNVS:n #####1 { #2 }
1406     \exp_args:Ne \BNVS:n {
1407       \int_value:w #1 \exp_stop_f:
1408     }
1409   } {
1410     \cs_set:Npn \BNVS:n #####1 { #3 }
1411     \BNVS:n { #1 }
1412   }
1413 }

```

__bnvs_normalize_S:c **__bnvs_normalize_S:c** {<var>}

If <var> contains a decimal integer annotation, normalize it (for example remove leading zeros).

```

1414 \BNVS_new:cpn { normalize_S:c } #1 {
1415   \BNVS_tl_use:Nv \__bnvs_normalize:nTF { #1 } {
1416     \__bnvs_tl_set:cn { #1 } { #####1 }
1417   } {}
1418 }

```

__bnvs_map:nnnn **__bnvs_map:nnnn** {<tag>} {<S code:n>} {<R code:n>} {<no:n>}

If the <tag> is not empty, execute <S code:n> for the first component and then apply <R code:n> to each next component. Otherwise, execute <no:n> with the <tag>.

```

1419 \BNVS_new:cpn { map_R:nnnn } #1 #2 #3 #4 {
1420   \tl_if_empty:nTF { #1 } {
1421     \cs_set:Npn \BNVS:n ##1 { #4 }
1422     \BNVS:n { #1 }
1423   } {
1424     \__bnvs_seq_set_split:cn R { . } { #1 }
1425     \__bnvs_seq_pop_left:cc R R
1426     \cs_set:Npn \BNVS:n ##1 { #2 }

```

```

```

6.11.3 Conversions

__bnvs_convert:nc [__bnvs_convert:nc](#) {<definitions>} {<var>}

Expand and convert <definitions> into <var>, on return the variable only contains characters with category code other.

```

1472 \BNVS_new:cpn { convert:nc } #1 #2 {
1473   \__bnvs_tl_set:ce { #2 } { \exp_args:Nc \cs_to_str:N { #1 } }
1474 }

```

__bnvs_prepare:nnc [__bnvs_prepare:nnc](#) {<key>} {<error>} {<var>}

Used by [__bnvs_prepare_crl:nc](#), [__bnvs_prepare_sqr:nc](#) and [__bnvs_prepare_rnd:nc](#).
Implementation detail: local functions [\BNVS:N](#) and [\BNVS_loop:](#).

```

1475 \BNVS_new:cpn { prepare:nnc } #1 #2 #3 {
1476   \cs_set:Npn \BNVS:N ##1 {
1477     \cs_set:Npn \BNVS_loop: {
1478       \exp_args:Nc \regex_replace_all:NnNT { c__bnvs_#1_n_regex } {
1479         \c { BNVS_#1:n } \cB \{ \1 \cE \}
1480       } ##1 {
1481         \BNVS_loop:
1482       }
1483     }
1484     \BNVS_loop:
1485     \exp_args:Nc \regex_match:NVT { c__bnvs_#1_regex } ##1 {
1486       \BNVS_error:n { #2 }
1487     }
1488   }
1489   \BNVS_tl_use:Nc \BNVS:N { #3 }
1490 }

```

[\c__bnvs_crl_n_regex](#) Used by [__bnvs_prepare_crl:c](#) and [__bnvs_resolve_prepare:nc](#).

```

1491 \regex_const:Nn \c__bnvs_crl_n_regex { \c0 \{ ( .*? ) \c0 \} }
      (End of definition for \c__bnvs_crl_n_regex.)

```

[\c__bnvs_crl_regex](#) Only used by [__bnvs_prepare_crl:c](#).

1497 ~\[]*) \] }
      (End of definition for \c__bnvs_sqr_n_regex.)
\c__bnvs_sqr_regex Only used by \__bnvs_prepare_sqr:c.
1498 \regex_const:Nn \c__bnvs_sqr_regex { \[|\] }
      (End of definition for \c__bnvs_sqr_regex.)

---

\__bnvs_prepare_sqr:c \__bnvs_prepare_sqr:c {<var>}
      Replace any literal [⟨...⟩] by \BNVS_sqr:n{⟨...⟩}.
1499 \BNVS_new:cpn { prepare_sqr:c } #1 {
1500   \__bnvs_prepare:nnc { sqr } { Unbalanced~[~or~] } { #1 }
1501 }

\c__bnvs_rnd_n_regex Only used by \__bnvs_prepare_rnd:c.
1502 \regex_const:Nn \c__bnvs_rnd_n_regex { \[ ( [%\]
1503 ~\[]*) \] }
      (End of definition for \c__bnvs_rnd_n_regex.)
\c__bnvs_rnd_regex Only used by \__bnvs_prepare_rnd:c.
1504 \regex_const:Nn \c__bnvs_rnd_regex { \[|\] }
      (End of definition for \c__bnvs_rnd_regex.)

---

\__bnvs_prepare_rnd:c \__bnvs_prepare_rnd:c {<var>}
      Replace any literal (⟨...⟩) by \BNVS_rnd:n{⟨...⟩}.
1505 \BNVS_new:cpn { prepare_rnd:c } #1 {
1506   \__bnvs_prepare:nnc { rnd } { Unbalanced~(~or~) } { #1 }
1507 }

---

\__bnvs_prepare:nc \__bnvs_prepare:nc {<definitions>} {<var>}
      Prepare the <definitions> into <var>. Expand and convert the <definitions>. Replace
      any literally material <...> enclosed between standard delimiters, by one of template
      \BNVS_crl:n{⟨...⟩}, \BNVS_sqr:n{⟨...⟩} or \BNVS_rnd:n{⟨...⟩}. After that, we are
      sure that commas are proper delimiters.
1508 \BNVS_new:cpn { prepare:nc } #1 #2 {
1509   \__bnvs_convert:nc { #1 } { #2 }
1510   \__bnvs_prepare_crl:c { #2 }
1511   \__bnvs_prepare_sqr:c { #2 }
1512   \__bnvs_prepare_rnd:c { #2 }
1513 }

```

6.11.4 Other utilities

```

1514 \BNVS_new:cpn { warn_until_s_stop:w } #1 \s_stop {
1515   \tl_if_empty:nF { #1 } {
1516     \BNVS_warning:n { Ignored:~#1 }
1517   }
1518 }
1519 \BNVS_new:cpn { scan_until_s_stop:w } {
1520   \peek_meaning:NTF \s_stop {
1521     \use_none:n
1522   } {
1523     \__bnvs_warn_until_s_stop:w
1524   }
1525 }

```

```

\__bnvs_peek_branch_until_s_stop:nnnw \__bnvs_peek_branch_until_s_stop:nnnw
{\<sqr:n>} {\<crl:n>} {\<non empty:n>} {\<empty:>}}
{...} \s_stop

```

Branch according to the following token. Each argument, except `<empty:>`, is the body of a function that takes one argument. It catches errors like `foo=[bar]baz`, where `baz` is not expected: no other argument should lay before `\s_stop`.

```

1526 \cs_new:Npn \BNVS_sqr:n { \exp_not:N \BNVS_sqr:n }
1527 \cs_new:Npn \BNVS_crl:n { \exp_not:N \BNVS_crl:n }

1573     #3
1574   }
1575   \BNVS_int_use:Nv \BNVS:n { next_index }
1576 }

```

6.12 Definition

Lower level function names generally contain `_gdef`. We parse definitions and collect material between curly or square brackets. There is a pretreatment before the storage to anticipate the resolution.

`\__bnvs_gdef:nnn` `\__bnvs_gdef:nnn {<id>} {<tag>} {<definition>}`
`\__bnvs_gdef:(vvn|nvn)`

Called by `\__bnvs_root_parsed:n` and `\__bnvs_root_parsed:nn`. Here is the **documentation**. The typical example of usage is `\Beanoves{<id>!<tag>=<definition>}`. If `<definition>` is empty, it clears out all the data, otherwise it calls `\__bnvs_ginit:nnn` to store the data.

```

1577 \BNVS_new:cpn { gdef:nnn } #1 #2 #3 {
1578   \__bnvs_peek_branch_until_s_stop:nnnnw {
1579     To manage <tag>=[<definitions>] call \__bnvs_sqr_gdef:nnn (and possibly itself):
1579     \__bnvs_sqr_gdef:nnn { #1 } { #2 } { ##1 }
1580   } {
1581     To manage <tag>={<definitions>} call \__bnvs_crl_gdef:nnn (and possibly itself):
1581     \BNVS_begin:
1581     To manage <tag>={{<definitions>}}:

```

```

1606 \BNVS_new:cpn { root_parsed:n } #1 {
1607   \__bnvs_if_ISR:nTF { #1 } {
1608     \__bnvs_gdef:vvn IT 1
1609   } {
1610     \BNVS_error:n { Unsupported~#1 }
1611   }
1612 }

```

__bnvs_root_parsed:nn **__bnvs_root_parsed:nn** {<key>} {<value>}

Called from **__bnvs_root_keyval:nc**. For **\Beanoves**{<key>=<definition>} instruction. At the root level, the <key> is either <path> or <id>!**<path>**, it is not a <subpath>. Calls **__bnvs_if_ISR:nTF** to parse the <key> and **__bnvs_gdef:nnn** to set the definition.

```

1613 \BNVS_new:cpn { root_parsed:nn } #1 #2 {
1614   \__bnvs_if_ISR:nTF { #1 } {
1615     \__bnvs_gdef:vvn IT { #2 }
1616   } {
1617     \BNVS_error:n { Unsupported~#1 }
1618   }
1619 }

```

__bnvs_root_keyval:nc **__bnvs_root_keyval:nc** {<definitions>} {<aux>}

Is called by **\BeanovesReset** and by **\Beanoves** through **__bnvs_root_keyval:NNn**, <definitions> directly comes from the user input. <aux> is an auxiliary variable only used within the body of the function, its content on input and output must be ignored whereas J may be updated.

1. Calls **__bnvs_prepare:nc** to prepare <definitions> into the <aux> variable, which will contain only characters (with category code other).
2. Parse with keyval based on **\keyval_parsed:nn** helped by **__bnvs_root_parsed:n** and **__bnvs_root_parsed:nn**.

```

1620 \BNVS_new:cpn { root_keyval:nc } #1 #2 {
1621   \__bnvs_prepare:nc { #1 } { #2 }
1622   \BNVS_tl_use:nv {
1623     \keyval_parse:NNn \__bnvs_root_parsed:n \__bnvs_root_parsed:nn
1624   } { #2 }
1625 }

```

__bnvs_root_keyval:NNn **__bnvs_root_keyval:NNn** <is at top> <on provide mode> {<definitions>}

Called by **\Beanoves**. Calls **__bnvs_root_keyval:nc** after some setup. The a tl auxiliary variable is used and, on return, the J variable may have been updated.

```

1626 \BNVS_new:cpn { root_keyval:NNn } #1 #2 #3 {
1627   \bool_if:NT #1 {
1628     \__bnvs_gclear:
1629   }
1630   \BNVS_begin:

```

☞ At the document level, clear everything.

```

1631 \bool_if:NTF #2 {
1632   \__bnvs_provide_ON:
1633 } {
1634   \__bnvs_provide_OFF:
1635 }
1636 \__bnvs_int_zero:c { i }
1637 \__bnvs_tl_set:cn a { #3 }
1638 \bool_if:NT #1 {
❧ At the document level, also use the global definitions.
1639   \seq_if_empty:NF \g__bnvs_def_seq {
1640     \__bnvs_tl_put_left:cx a {
1641       \seq_use:Nn \g__bnvs_def_seq , ,
1642     }
1643   }
1644 }
1645 \BNVS_tl_use:Nv \__bnvs_root_keyval:nc a a
  This is a list, possibly at the top
1646 \BNVS_end_tl_set:cv J J
1647 }

```

`\Beanoves` `\Beanoves {<key-value list>}`

The keys are the slide overlay references. When no value is provided, it defaults to 1. On the contrary, `<key-value>` items are parsed by `\__bnvs_root_keyval:NNn`.

```

1648 \NewDocumentCommand \Beanoves { sm } {
1649   \__bnvs_set_false:c { reset }
1650   \__bnvs_set_false:c { reset_all }
1651   \__bnvs_set_false:c { only }
1652   \tl_if_empty:NTF \@currenvir {
❧ In the preamble, record the definitions globally for later use. No expansion yet.
1653     \seq_gput_right:Nn \g__bnvs_def_seq { #2 }
1654   } {
1655     \tl_if_eq:NnTF \@currenvir { document } {
1656       \IfBooleanTF {#1} {
1657         \__bnvs_root_keyval:NNn \c_true_bool \c_true_bool
1658       } {
1659         \__bnvs_root_keyval:NNn \c_true_bool \c_false_bool
1660       }
1661     } {
1662       \IfBooleanTF {#1} {
1663         \__bnvs_root_keyval:NNn \c_false_bool \c_true_bool
1664       } {
1665         \__bnvs_root_keyval:NNn \c_false_bool \c_false_bool
1666       }
1667     } { #2 }
1668     \ignorespaces
1669   }
1670 }

```

If we use the frame `beanoves` option, we can provide default values to the various overlay set names through the use of `\Beanoves*`.

```

1671 \define@key{beamerframe}{beanoves}{\Beanoves*{#1}}

```

6.13 Scanning named overlay specifications

Patch some beamer commands to support `?(...)` instructions in overlay specifications.

<code>_bnvs_@frame</code> <code>_bnvs_@masterdecode</code>	<code>_bnvs_@frame {<overlay specification>}</code> <code>_bnvs_@masterdecode {<overlay specification>}</code>
---	---

Preprocess `<overlay specification>` before beamer reads it. Both call `\_bnvs\_resolve:nc`.
Storage for the translated overlay specification, `<...>` instructions are replaced by their static counterparts.
(End of definition for `\l\_bnvs\_ans\_tl`.)

Save the original macros `\beamer@frame` and `\beamer@masterdecode` then override them to properly preprocess the argument. We start by defining the overloads.

```

1672 \makeatletter
1673 \cs_set:Npn \_bnvs\_@frame < #1 > {
1674   \BNVS\_begin:
1675   \_bnvs\_tl\_clear:c { ans }
1676   \_bnvs\_resolve:nc { #1 } { ans }
1677   \BNVS\_set:cpn { :n } ##1 { \BNVS\_end: \BNVS\_saved@frame < ##1 > }
1678   \BNVS\_tl\_use:cv { :n } { ans }

1711 \makeatother

```

6.14 Resolution

Resolution means to transform $?(\langle \text{queries} \rangle)$ and alike into static beamer range expressions. This is a quite complex task because we allow at the same time algebraic expressions and beamer range expressions which seem like differences but are not algebraic expressions by themselves. Function names generally contain “resolve”.

Each individual query is scanned multiple times, changing parts on each step to finally obtain only raw integers (along with management markers). Overall sketch: `\__bnvs_resolve:nc` is the top level resolution function. It is called by `\__bnvs_@frame`, `\__bnvs_@masterdecode` or `\BeanovesResolve` and for the resolution of embedded subqueries $?(\langle \text{queries} \rangle)$ or $!:(\langle \text{queries} \rangle)$ as well. The main functions used for resolution are

❧ `\__bnvs_resolve_query:nc`, called first, the input is a raw query, which is not a clist object, on return the answer is **(IN PROGRESS)**

- `\BNVS_V:w{\langle v \rangle}`, for a single integer literal value $\langle v \rangle$,
- `\BNVS_AZ:w{\langle a \rangle}{\langle z \rangle}`, for a single range of integers from literal integer $\langle a \rangle$ to literal integer $\langle z \rangle$, or from literal integer $\langle a \rangle$ if $\langle z \rangle$ is empty,
- `\BNVS_comma:` for commas

The result may be used as a single integer value as well as a beamer list of ranges. Depending on the context, the functions will be defined appropriately.

❧ `\__bnvs_resolve_prepare:nc`, called first by `\__bnvs_resolve_query:nc`, on return the prepared material consists of

- `\BNVS_rnd:n{\langle \dots \rangle}` for material between rounded brackets,
- `\BNVS_bIKSRa:w{\langle b \rangle}{\langle I \rangle}{\langle K \rangle}{\langle S \rangle}{\langle R \rangle}{\langle a \rangle}`, for specifications
- `\BNVS_n:n{\langle \dots \rangle}` for an integer expression between square brackets,
- `\BNVS_s:n{\langle \dots \rangle}` for a general subquery inside $?(\langle \dots \rangle)$,
- `\BNVS_assign:n{\langle /+/? \rangle}`, for $=$, $+=$ or $?=$,
- `\BNVS_two_colons:` and `\BNVS_colon:` are range delimiters
- `\BNVS_comma:` for commas
- `\BNVS_raw_to_stop:w{\langle raw text \rangle}\s_stop` for everything else.

❧ `\__bnvs_resolve_subqueries:c`, after resolution of subqueries the material consists of

- `\BNVS_bISRa:w{\langle b \rangle}{\langle I \rangle}{\langle S \rangle}{\langle R \rangle}{\langle a \rangle}`, for specifications
- `\BNVS_N:w{\langle \dots \rangle}` for a single static resolved integer,
- `\BNVS_S:w{\langle \dots \rangle}` containing output similar to that of `\__bnvs_resolve_query:nc`,
- `\BNVS_assign:n{\langle /+/? \rangle}`, for $=$, $+=$ or $?=$,
- `\BNVS_two_colons:` and `\BNVS_colon:`, range delimiters.
- `\BNVS_comma:` for commas
- `\BNVS_raw:n{\langle raw text \rangle}` for everything else.

❧ `\__bnvs_resolve_check:c` after resolution the material consists of

- `\BNVS_bISRa:w{⟨b⟩}{⟨I⟩}{⟨S⟩}{⟨R⟩}{⟨a⟩}`, for specifications
- `\BNVS_N:w{⟨...⟩}` for a single static resolved integer,
- `\BNVS_S:w{⟨...⟩}` for a comma separated list of static resolved $\langle A \rangle$, $\langle A \rangle$: and $\langle A \rangle$: $\langle Z \rangle$ ranges, $\langle A \rangle$ and $\langle Z \rangle$ being unsigned integer decimal denotations,
- `\BNVS_assign:n{⟨/+/?⟩}`, for =, += or ?=,
- `\BNVS_two_colons:` and `\BNVS_colon:`, range delimiters.
- `\BNVS_comma:` for commas
- `\BNVS_raw:n{⟨raw text⟩}` for everything else.

¶ `\_bnvs_resolve_rhs:c` after resolution of assignments the material consists of
(IN PROGRESS)

- `\BNVS_V:w{⟨v⟩}`, for a single integer literal value $\langle v \rangle$,
- `\BNVS_AZ:w{⟨a⟩}{⟨z⟩}`, for a single range of integers from literal integer $\langle a \rangle$ to literal integer $\langle z \rangle$, or from literal integer $\langle a \rangle$ if $\langle z \rangle$ is empty,
- `\BNVS_comma:` for commas

¶ `\_bnvs_resolve_assign:nc` after resolution of assignments the material consists of

- `\BNVS_bISRa:w{⟨b⟩}{⟨I⟩}{⟨S⟩}{⟨R⟩}{⟨a⟩}`, for specifications
- `\BNVS_N:w{⟨...⟩}` for a single static resolved integer,
- `\BNVS_S:w{⟨...⟩}` for a comma separated list of static resolved $\langle A \rangle$, $\langle A \rangle$: and $\langle A \rangle$: $\langle Z \rangle$ ranges, $\langle A \rangle$ being positive and $\langle Z \rangle$ being nonnegative,
- `\BNVS_two_colons:` and `\BNVS_colon:`, range delimiters.
- `\BNVS_comma:` for commas
- `\BNVS_raw:n{⟨raw text⟩}` for everything else.

¶ `\_bnvs_assign:Nwnnc`

These functions define the function in the input and run the input.

The top level queries are a comma separated list of individual queries as augmented range specifications. Each individual query is temporarily stored in its own variable, then commands are inserted as markup. This variable is then executed to feed the top level resolution variable.

The augmentations in individual queries can take different forms. At the top level we have only $?(\langle queries \rangle)$ or $!:(\langle queries \rangle)$ and inside we may have

- embedded $?(\langle queries \rangle)$ or $!:(\langle queries \rangle)$,
- colon delimited ranges,
- various assignments (standard, with increment and as provider),
- references with possible square brackets specification,
- pre and post increment.

The right hand side expression in assignments may contain commas. In that case there can be a conflict with top level commas. To avoid such ambiguity, one can put rounded brackets around the critical part.

`\c__bnvs_bIKSRa_regex` Used by `\__bnvs_resolve_prepare:nc`.

$\langle b \rangle$: an optional collection of ++ prefixes,

$\langle I \rangle$: an optional $\langle id \rangle$

$\langle K \rangle$: followed by a “!”, or

$\langle S \rangle$: an optional “short name”,

$\langle R \rangle$: a dotted path, including litteral optionally signed integer,

$\langle a \rangle$: an optional collection of ++ suffixes.

```

1712 \regex_const:Nn \c__bnvs_bIKSRa_regex {
1713   ( (? : \+ \+ ) * )
1714   (? : ( \ur{c__bnvs_S_regex} ) ? ( ! ) ) ?
1715   ( \ur{c__bnvs_S_regex} )
1716   ( (? : \. \ur{c__bnvs_R_regex} ) * )
1717   ( (? : \+ \+ ) * )
1718   \s*
1719 }
(End of definition for \c__bnvs_bIKSRa_regex.)

```

`\__bnvs_resolve_prepare:nc` `\__bnvs_resolve_prepare:nc {<queries>} {<var>}`

Called by `\__bnvs_resolve_query:nc` and by `\__bnvs_resolve_queries:nc`. Prepare the $\langle queries \rangle$ into $\langle var \rangle$. Inside $\langle queries \rangle$, ranges are denoted with a colon syntax.

On return, every material has been tagged between commands, as a function or a command argument. More precisely $\langle var \rangle$ consists of

- `\BNVS_rnd:n{<...>}` for material between rounded brackets,
- `\BNVS_bIKSRa:w{<b>}{<I>}{<K>}{<S>}{<R>}{<a>}`, for specifications
- `\BNVS_n:n{<...>}` for an integer expression between square brackets,
- `\BNVS_s:n{<...>}` for a general subquery inside $?(<...>)$,
- `\BNVS_assign:n{<|+/?>}`, for =, += or ?=,
- `\BNVS_two_colons:` and `\BNVS_colon:` are range delimiters
- `\BNVS_comma:` for commas
- `\BNVS_raw_to_stop:w<raw text>\s_stop` for everything else.

```

1720 \BNVS_new:cpn { resolve_prepare:nc } #1 #2 {
❧ One shot function, subsequent calls within the same group are just restricted to the raw
  assignement of <queries> to <var>, because the <queries> argument here is some part
  of a more general <queries> that has already been prepared.
1721   \BNVS_set:cpn { resolve_prepare:nc } ##1 ##2 {
1722     \__bnvs_tl_set:cn { ##2 } { ##1 }
1723   }
❧ Turn the queries into a string by expanding macros, #2 will contain only characters.

```

```

1724 \tl_if_empty:nTF { #1 } {
1725   \__bnvs_tl_clear:c { #2 }
1726 } {
1727   \__bnvs_tl_set:ce { #2 } { \exp_args:Nc \cs_to_str:N { #1 } }
1728 }

```

❗ Enclose the material between commas, there is no grouping yet so this is not a comma separated list. The leading and trailing marks will be inserted at the end of this function body.

```

1729 \BNVS_tl_use:Nc \tl_replace_all:Nnn { #2 }
1730 { , } { \s_stop \BNVS_comma: \BNVS_raw_to_stop:w}

```

❗ Replace “(⟨...⟩)” with

```

\s_stop
\BNVS_rnd:n{\BNVS_raw_to_stop:w⟨...⟩\s_stop}
\BNVS_raw_to_stop:w.

```

Standard delimiters are expected to be properly balanced, no error recovery policy for that matter. Category codes now come back into play.

```

1731 \cs_set:Npn \BNVS_loop: {
1732   \BNVS_tl_use:nc { \regex_replace_all:NnNT \c__bnvs_rnd_n_regex {
1733     \c { s_stop }
1734     \c { BNVS_rnd:n } \cB \{
1735     \c { BNVS_raw_to_stop:w } \1 \c { s_stop }
1736     \cE \}
1737     \c { BNVS_raw_to_stop:w }
1738   } } { #2 } \BNVS_loop:
1739 }
1740 \BNVS_loop:

```

1776 }

```

_bnvs_resolve_queries:nc _bnvs_resolve_queries:nc {<queries>} {<ans>}

One of the top level resolution entry point. May be called recursively. For each individual <query> of the <queries> clist, it replaces in the <queries> all the ?(<...>) query instructions as well as [<...>] index references with their static counterpart then it evaluates the instructions to obtain a single value or a set of references. Ranges are in colon (:) syntax. The function `\_bnvs_resolve_query:nc` is called for each individual query in the <queries> clist. The `Q seq` variable stores the specifications whereas the `Q tl` variable stores the result. The implementation is not highly efficient in the sense that queries are scanned multiple times, but it does not cost that much as long as queries are reasonably short.

```

```

\__bnvs_resolve_argument:c \__bnvs_resolve_argument:c {<query var>}
\__bnvs_resolve_argument:nc \__bnvs_resolve_argument:nc {<argument>} {<var>}

```

Called by `\__bnvs_resolve_subqueries:nc`.

On input, `<query>` or `<var>` consists of

- `\BNVS_rnd:n{<...>}` for material between rounded brackets,
- `\BNVS_bIKSRa:w{<b>}{<I>}{<K>}{<S>}{<R>}{<a>}`, for specifications
- `\BNVS_n:n{<...>}` for an integer expression between square brackets,
- `\BNVS_s:n{<...>}` for a general subquery inside `?(<...>)`,
- `\BNVS_assign:n{</+/?>}`, for `=`, `+=` or `?=`,
- `\BNVS_two_colons:` and `\BNVS_colon:` are range delimiters
- `\BNVS_comma:` for commas
- `\BNVS_raw_to_stop:w{raw text}\s_stop` for everything else.

and on output, `<var>` consists of

- `\BNVS_bISRa:w{<b>}{<I>}{<S>}{<R>}{<a>}`, for specifications
- `\BNVS_N:w{<...>}` for a single static resolved integer,
- `\BNVS_S:w{<...>}` for a comma separated list of static resolved `<A>`, `<A>`: and `<A>:<Z>` ranges, `<A>` being positive and `<Z>` being nonnegative,
- `\BNVS_two_colons:` and `\BNVS_colon:`, range delimiters.
- `\BNVS_comma:` for commas
- `\BNVS_raw:n{<raw text>}` for everything else.

The `<query var>` is executed after the commands it contains are defined on the run. use `\__bnvs_resolve_query:nc`. Run inside a group.

```

1813 \BNVS_new:cpn { resolve_argument:nc } #1 #2 {
1814     \BNVS_begin:

```

```

1815 \__bnvs_resolve_subqueries:nc { #1 } Q
1816 \__bnvs_resolve_check:c Q
1817 \__bnvs_resolve_assign:c Q
1818 \BNVS_tl_set:ncvcvcv { \BNVS_end: } { #2 } Q I I P P
1819 }

```

Raw text.

```

\__bnvs_resolve_subqueries:c \__bnvs_resolve_subqueries:c {<query var>}
\__bnvs_resolve_subqueries:nc \__bnvs_resolve_subqueries:nc {<query>} {<var>}

```

Called after `\__bnvs_resolve_prepare:nc`. Only relies on `\__bnvs_resolve_argument:nc`.
On input, `<query>` or `<var>` consists of

- `\BNVS_rnd:n{<...>}` for material between rounded brackets,
- `\BNVS_bIKSRa:w{<b>}{<I>}{<K>}{<S>}{<R>}{<a>}`, for specifications
- `\BNVS_n:n{<...>}` for an integer expression between square brackets,
- `\BNVS_s:n{<...>}` for a general subquery inside `?(<...>)`,
- `\BNVS_assign:n{</+/?>}`, for `=`, `+=` or `?=`,
- `\BNVS_two_colons:` and `\BNVS_colon:` are range delimiters
- `\BNVS_comma:` for commas
- `\BNVS_raw_to_stop:w{raw text}\s_stop` for everything else.

and on output, `<var>` consists of

- `\BNVS_bISRa:w{<b>}{<I>}{<S>}{<R>}{<a>}`, for specifications
- `\BNVS_N:w{<...>}` for a single static resolved integer,
- `\BNVS_S:w{<...>}` containing output similar to that of `\__bnvs_resolve_query:nc`,
- `\BNVS_assign:n{</+/?>}`, for `=`, `+=` or `?=`,
- `\BNVS_two_colons:` and `\BNVS_colon:`, range delimiters.
- `\BNVS_comma:` for commas
- `\BNVS_raw:n{<raw text>}` for everything else.

The `<query var>` is executed after the commands it contains are defined on the run. In particular, `\BNVS_n:n` and `\BNVS_s:n` use `\__bnvs_resolve_query:nc`. Run inside a group.

<code>__bnvs_resolve_rhs:c</code> <code>__bnvs_resolve_rhs:nc</code>	<code>__bnvs_resolve_rhs:c {⟨query var⟩}</code> <code>__bnvs_resolve_rhs:nc {⟨query⟩} {⟨var⟩}</code>
---	---

Only called by `\__bnvs_resolve_assign:nc`. Resolve in place the `⟨query var⟩`. On input, the `⟨query⟩` or the contents of the `⟨query var⟩` **consists of**

- `\BNVS_bISRa:w{⟨b⟩}{⟨I⟩}{⟨S⟩}{⟨R⟩}{⟨a⟩}`, for specifications
- `\BNVS_N:w{⟨...⟩}` for a single static resolved integer,
- `\BNVS_S:w{⟨...⟩}` for a comma separated list of static resolved `⟨A⟩`, `⟨A⟩:` and `⟨A⟩:⟨Z⟩` ranges, `⟨A⟩` being positive and `⟨Z⟩` being nonnegative,
- `\BNVS_two_colons:` and `\BNVS_colon:`, range delimiters.
- `\BNVS_comma:` for commas
- `\BNVS_raw:n{⟨raw text⟩}` for everything else.

and on return, **it contains only one of next object between each range delimiters**

- `\BNVS_bISRa:w{⟨b⟩}{⟨I⟩}{⟨S⟩}{⟨R⟩}{⟨a⟩}`, for specifications
- `\BNVS_N:w{⟨...⟩}` for a single static resolved integer,
- `\BNVS_S:w{⟨...⟩}` for a comma separated list of static resolved `⟨A⟩`, `⟨A⟩:` and `⟨A⟩:⟨Z⟩` ranges, `⟨A⟩` being positive and `⟨Z⟩` being nonnegative,
- `\BNVS_two_colons:` and `\BNVS_colon:`, range delimiters.
- `\BNVS_comma:` for commas
- `\BNVS_raw:n{⟨raw text⟩}` for everything else.
